

Fernwick Relay operations manual

Page 1. Regions and data residency

Fernwick Relay runs in three regions: eu-north, us-east, and ap-south. A workspace chooses its region when it is created, and the region cannot be changed later. Webhook payloads never leave the region of the workspace that received them.

Page 2. Maintenance and retention

Planned maintenance happens every Sunday between 02:00 and 03:00 UTC. Inbound addresses keep accepting webhooks during maintenance, and deliveries resume when the window ends.

Delivery logs are kept for 14 days on every plan. Payload bodies are kept for 3 days and then deleted, even when the delivery failed.

Page 3. Incident response

Incidents have three severities. A SEV1 incident stops deliveries for more than one workspace; the on-call engineer responds within 15 minutes. A SEV2 incident delays deliveries; the response target is 1 hour. A SEV3 incident affects a single feature; the response target is one business day. Status updates are posted at `status.fernwick.example` every 30 minutes during a SEV1 incident.
